

# Quick Start RabbitMQ (RMQ)

A Hitchhiker's Guide to AMQP 0-9-1

# Protocol

- RMQ uses the AMQP protocol to transport messages
  - RMQ uses AMQP 0-9-1
  - This is a significantly different protocol to AMQP 1-0
  - AMQP 1-0 implementations include Azure Service Bus and Azure Event Hubs
- Further reading:
  - [AMQP 0-9-1](#)
  - [RMQ and AMQP 0-9-1](#)

## Durable

RMQ uses the term durable for persistent configuration i.e. will survive restarts of the server. If a definition is not defined as durable it is transient and won't survive a restart

### Rabbit MQ Primitive:

Create a connection to RMQ

### Connections

RMQ uses a multiplexed TCP/IP connections to connect to the server. A connection factory creates a connection, and you then create a channel on it. In production code **pool** connections.

Declare an Exchange of Desired Type

### Exchanges

An exchange is the routing table for your messages. You may use multiple exchanges if you want to create multiple routing scopes i.e. one per microservice that publishes messages.

Create a Queue

### Queues

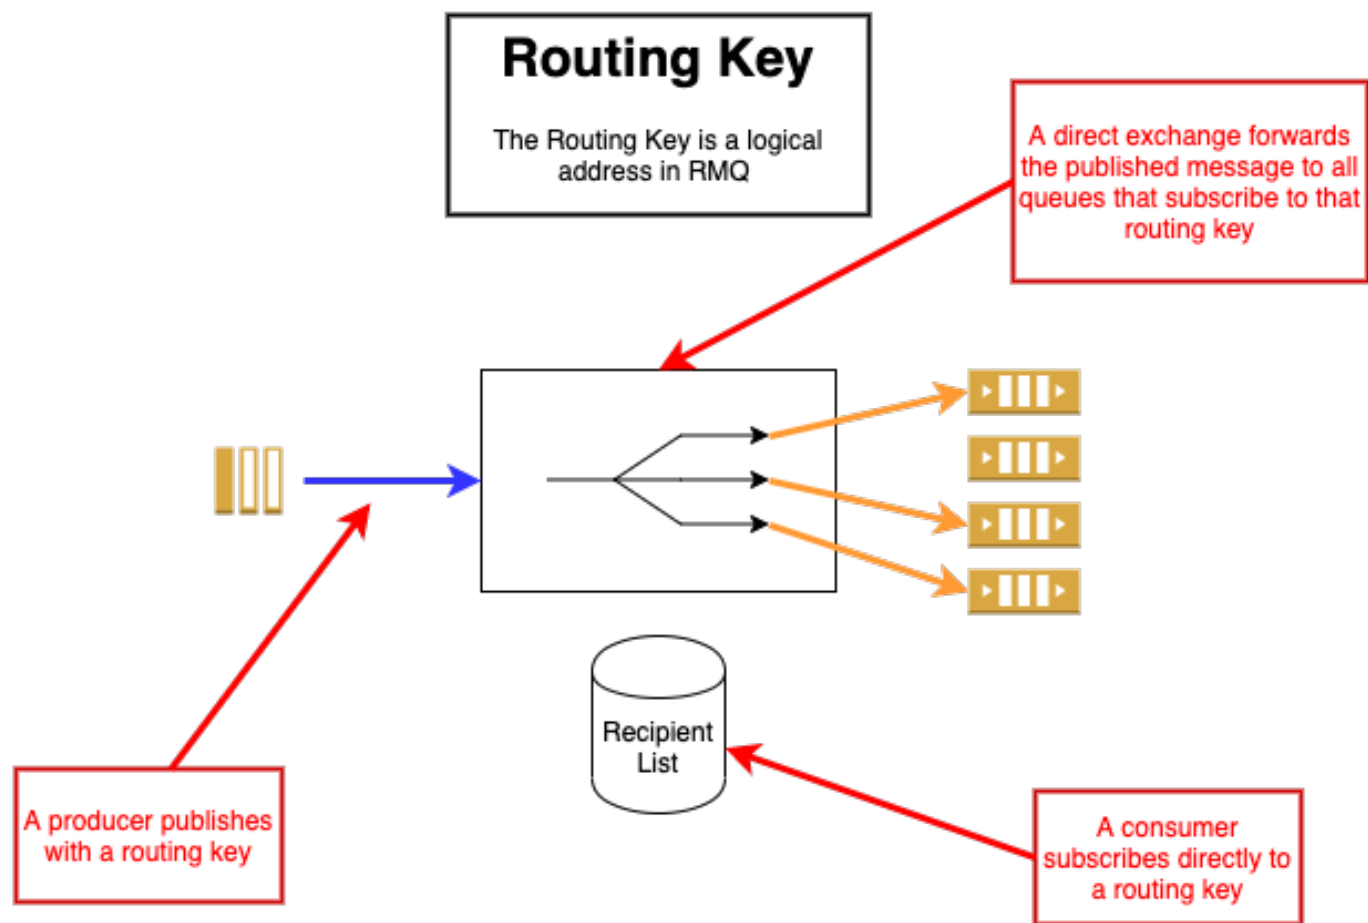

An RMQ queue supports FIFO delivery of messages. A message is **locked** when read until acked or nacked. A queue supports multiple consumers as others can read past the locked message.

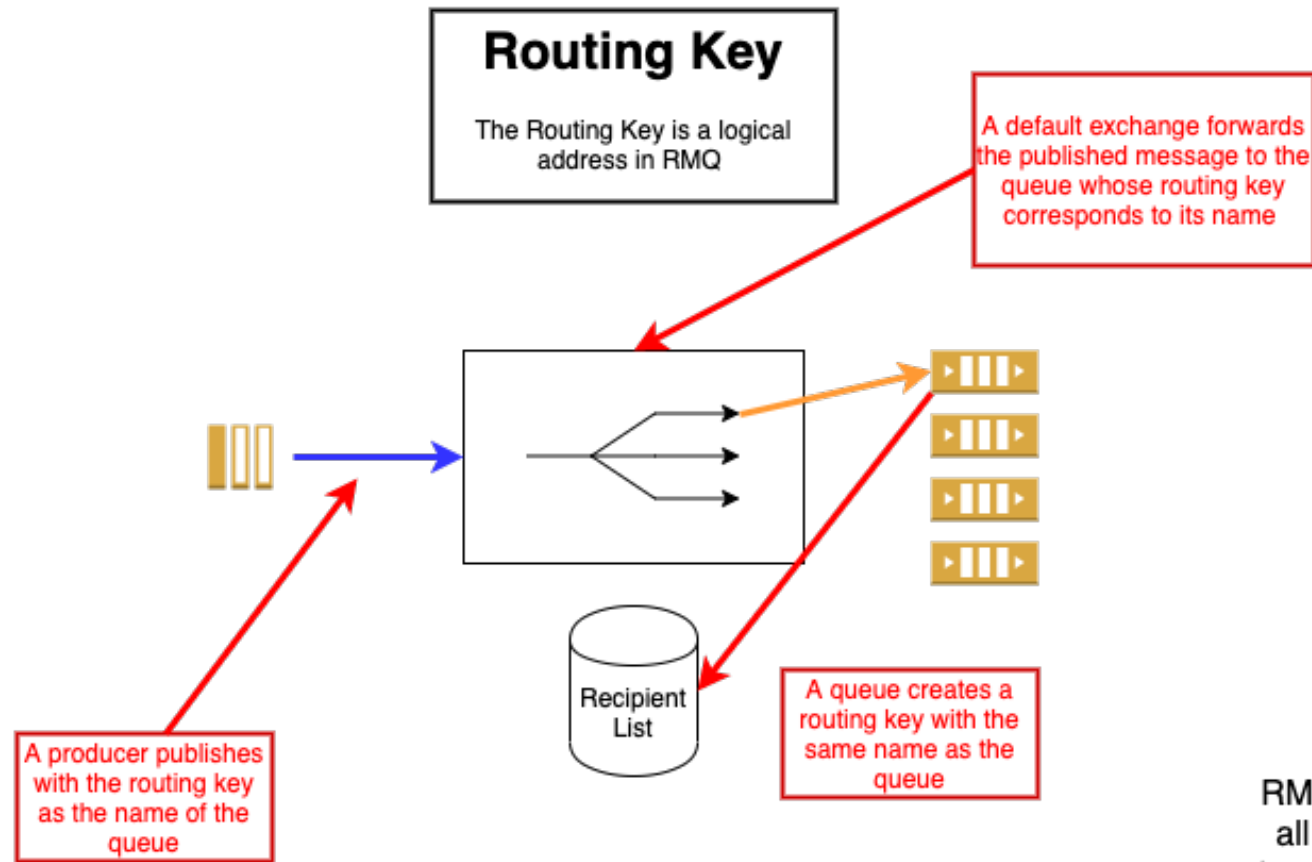

Bind the Queue to a Routing Key in the Exchange

### Binding

Binding is the key step in association the queue with an exchange

Rabbit MQ Direct Exchange

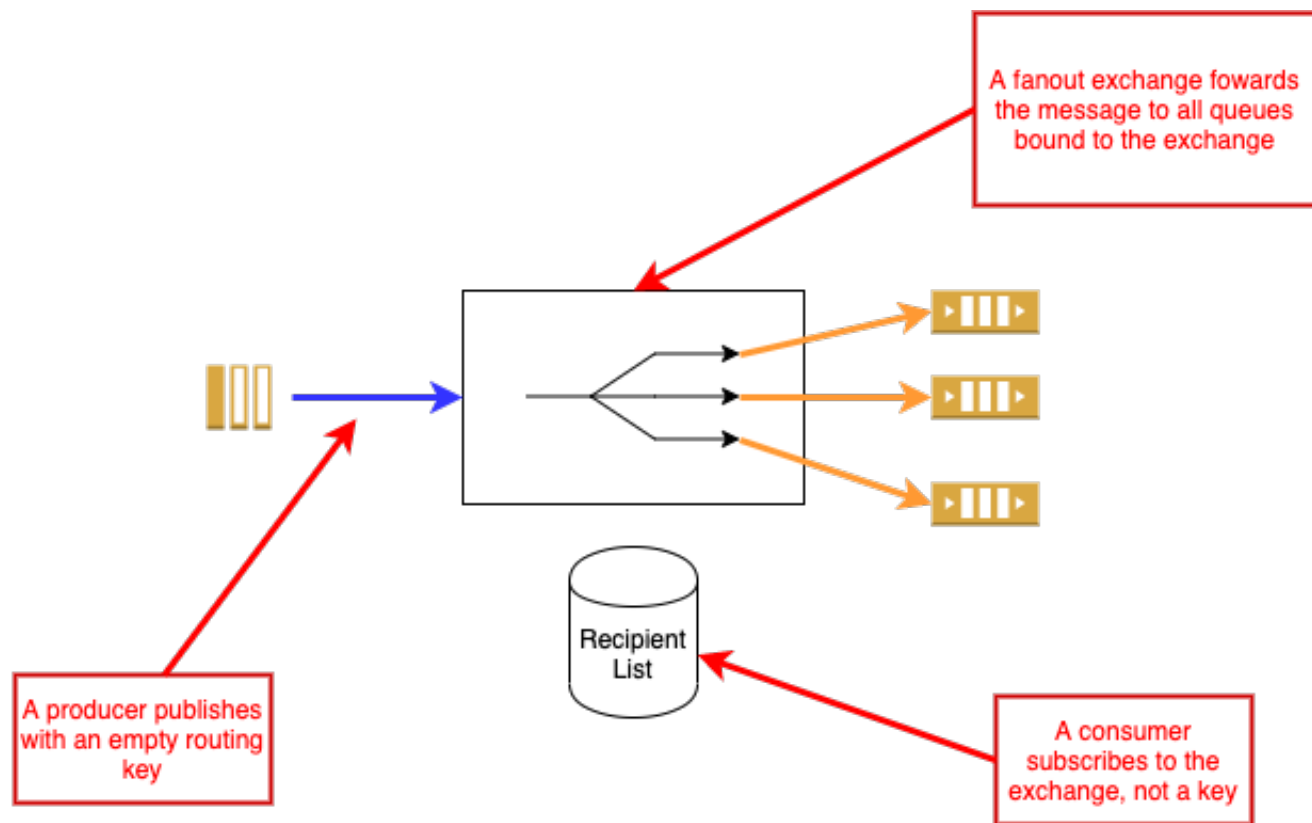

## Rabbit MQ Default Exchange

### Point-to-Point

RMQ uses an exchange as a router in all topologies. The closest approach to point-to-point is the direct exchange as a message will always go to one, and only one queue.

## Rabbit MQ Fanout Exchange

### Binding

In a Fanout Exchange, we just bind with an empty routing key, because all queues receive each message
